

Ball bushes

Ball bushes are the mainstay of linear motion systems. They provide an economical solution for precision measuring equipment, drilling machines, punching presses, printing and food packaging machines. Bushes are available in open and closed formats, flanged and slim profile forms. The correct tolerance and hardened shaft must be used for reliable performance and these can be supplied with chrome plating or 440 stainless steel. In general ball bushes are better for lighter loads and lower duty cycles.

Complete systems can be supplied for bolt in simplicity including precision ground and hardened shafts, bushes, case units and shaft supports. Dimensions are to an industry standard for consistency and parts for breakdowns are normally readily available.

Bushes with Nickel coating and SS balls for aggressive chemical environments can be supplied on request.

Super ball – Long life self-aligning

These types are dimensionally equivalent to LME series bushes. Load is carried from the shaft through the balls and onto crowned, hardened load bearing inserts. The inserts, return tubes and end seals and encapsulated in an engineering plastic frame.

Housing for Japanese bushes are available on indent.

All data is for housings without bushes.

Can be assembled with Simplicity plain bush, Super ball or standard ball bushes.

Hardened ground shafts

Linear shafting is suitable for most linear guide applications including pneumatic or hydraulic cylinder rods. Most sizes from 10 to 60mm are available in 3m maximum length and can be cut to required lengths. Shafts are made for linear applications and not manufactured to a roundness tolerance.

Bearing steel shafts

- Material SUJ 2 bearing steel
- Chrome plated to 0.5-1.0µm
- Sizes from 5 to 60 from stock
- Induction hardened to H_rC 55°-64°
- Shaft tolerance g6
- Surface roughness less than 1.5s

Support rail

Support rail components and assemblies are a low performance option. In practice this type of solutions severely reduces load capacities and are susceptible to environment contamination. For new applications rail solutions such as compact rail and LM profile rail are recommended.
